Large caps & Futures Setup

Note: the same setup and concept applies to you trading futures. I have not taught or added anything related to futures so if you are an experienced trader, you can use my custom indicator sets for large caps on futures as well. **1 Screen Workspace Setup:** <http://tos.mx/!b6tGqbUr> Here you have a 1 screen setup for large caps/futures. You have a flexible grid with your 2min, 15 min and Daily timeframe setup. If you click "Charts" at the top next to flexible grid you can watch 4 different large cap stocks or Future indices at once with the 2/15min charts. On the left side of your software you will see a watchlist of the different Future Indices and large caps you will be trading, these are linked to your charts so if you click the symbol it will load on all of your charts. Once you have imported any of the workspaces, you then need to load your study sets. The study sets that you'll be using are found in unknown if you're trading futures

Study Sets

Here you will find the links to your workspace and study sets, which are your Technical Analysis setups for Large caps/Futures. To import these study sets, first copy the relative link for the study set then go to the top right of Thinkorswim, click "Setup", then click "Open Shared Item", paste the link, click "Preview" then finally click "Import". Once you have done this a chart will appear with your studies, make sure to save this as a study set, to do this you can right click the chart, then hover over "Studies" then save it as as study set. Once you have done this you are now able to load this study set to any of your charts. Another thing you MUST do once the chart appears is to save the STYLE, you only need to do this once. Now that you have saved the style you can load this style onto any of your charts.

Study Sets 2min: <http://tos.mx/!ScXHtOui> **15min:** <http://tos.mx/!HC5dxqUC> **Daily:** <http://tos.mx/!dUKM6QHM>

Large caps/Futures only Indicators

On your 2 Minute & 15 Minute charts you have multiple different Support/Resistance lines automatically plotted for you. These are key Simple Moving Averages & Exponential Moving Averages on the Daily timeframe which are in Support/Resistance form on your 2 Minute. They are colour coded & some are solid lines, some are dashed.

Yellow Solid Line - 10SMA Daily **Yellow Dashed Line** - 10EMA Daily **Pink Solid Line** - 20SMA Daily **Pink Dashed Line** - 21EMA Daily **Orange Dashed Line** - 34EMA Daily **Cyan Solid Line** - 50SMA Daily **Cyan Dashed Line** - 50EMA Daily **Red Solid Line** - 100SMA Daily **Red Dashed Line** - 100EMA Daily **Light Purple Solid Line** - 200SMA Daily **Light Purple Dashed Line** - 200EMA Daily These lines are KEY Support/Resistance & can be used for Entries & Exits

glossary

A

Ask Price – The lowest price a seller is willing to accept for an asset. **Arbitrage** – Buying and selling the same asset in different markets to profit from price differences.

B

Bear Market – A market characterized by declining prices. **Bid Price** – The highest price a buyer is willing to pay for an asset. **Breakout** – When the price moves above resistance or below support, signaling a potential trend. **Bull Market** – A market characterized by rising prices.

C

Candlestick Chart – A chart type that shows price action using candlesticks. **Consolidation** – A period where price moves within a narrow range before a breakout.

D

Day Trading – Buying and selling assets within the same trading day. **Divergence** – When price moves in the opposite direction of an indicator, signaling a potential reversal. **Drawdown** – The percentage drop from the peak to the lowest point in an account balance.

E

Entry Point – The price level at which a trader opens a position. **Exit Point** – The price level at which a trader closes a position. **Extension** – The candle is far above the 8 EMA, and a resistance level is failing to break or hit, indicating the move is weakening and a pullback is likely. **Exponential Moving Average (EMA)** – A type of moving average that gives more weight to recent prices.

F

Float – Refers to the number of a company's shares that are available for public trading, excluding restricted or insider-held shares. **FOMO (Fear of Missing Out)** – Emotional trading caused by the fear of missing opportunities. **Fundamental Analysis** – Analyzing economic data and financial statements to evaluate an asset's value. -

G

Gap – A price level where no trading occurs, leading to a jump in price. **Going Long** – Buying an asset in anticipation of a price increase. **Going Short** – Selling an asset in anticipation of a price decrease.

H

Hedge – A strategy used to reduce risk by opening offsetting positions. **Halt** – trading of a particular stock is temporarily stopped/suspended **Hold Number** – key price level which is great to take entries off of

I

Indicators – Tools used in technical analysis (e.g., EMA, Momentum, TTM Squeeze). **Inflation** – The rate at which the general price of goods and services rises. **Intrinsic Value** – The real value of an asset based on fundamental analysis. **In Play Number** – key price level used to determine a target for trading. If a stock is below the in play number, it is considered not worth trading or a target.

K

Key Resistance Level – A price point where selling pressure is expected to increase. **Key Support Level** – A price point where buying pressure is expected to increase.

L

Large-Cap Stocks – Companies with a market capitalization of over \$10 billion. **Leverage** – Borrowing money to increase trade size, amplifying gains and losses. **Liquidity** – The ease of buying or selling something without its price changing too much. **Limit Order** – An order to buy or sell at a specific price or better.

M

MACD (Moving Average Convergence Divergence) – A trend-following momentum indicator. **Margin** – Borrowed funds from a broker to trade larger positions. **Market Order** – An order to buy or sell immediately at the best available price.

N

NASDAQ – A U.S. stock exchange focusing on tech companies. **Naked Trading** – Trading without indicators, relying only on price action. **Net Profit** – Total earnings after deducting trading costs.

O

OHLC (Open, High, Low, Close) – Four key price points of a candlestick in a trading session. **Options** – Derivative contracts giving the right to buy or sell an asset at a set price. **Overbought/Oversold** – When an asset's price is considered too high or too low, based on indicators. **Over The Counter (OTC)** – Shares of companies that don't trade on major stock exchanges, instead traded through a network of dealers.

P

Pullback – A temporary price drop within an overall uptrend. **Penny Stock** – A stock that trades below \$1, often speculative and can be over-the-counter.

Q

Quarterly Earnings – A company's financial performance report every three months.

R

Resistance – A price level where there are a lot of sellers. **Resistance Hit** – A candle has hit the resistance price level but has not closed above (broken). **Resistance Breaks** – A candle closes above the resistance price level. **Risk-Reward Ratio** – The ratio of potential profit to potential loss in a trade. **Return on Investment (ROI)** – A measure of profitability relative to investment cost. **Reverse Split** – A corporate action that reduces the number of shares but increases the price per share.

S

Scalping – A strategy involving quick trades for small profits. **Short Selling** – Borrowing and selling shares to profit from a decline in price. **Small-Cap Stocks** – Companies with a market capitalization of \$300 million to \$2 billion. **Stock Split** – A corporate action that increases the number of shares while reducing the price per share. **Slippage** – The difference between the expected and actual price of an order execution. **Support** – A price level where there are more buyers. **Squeeze** – When a stock price rises very quickly.

T

Take Profit (TP) – A price level where a trader exits to lock in gains. **Trailing Stop** – A stop-loss that moves with the price to secure profits. **Technical Analysis** – Analyzing past price data and indicators to predict future movements.

U-Z

Underlying Asset – The asset that a derivative contract is based on. **Volatility** – The degree of price fluctuations in an asset. **VWAP (Volume Weighted Average Price)** – An indicator that shows where shorts are

HOW TO USE ALERTS:

#👤 how-to-use-alerts

📶🔔🌟👤

Search

August 4, 2024

Young Bull Investor

8/4/24, 12:44 AM

My alerts are not blind signals, ‘buy here’ and ‘sell here’. We are an education first community that builds confident, successful, and decisive traders.

I am not a believer in blind alerts because:

1. Circumstances on a stock can change within a minute or within a second.

2. You will never be able to trade independently by following blindly

3. It's not possible for me to tell you when to buy and when to sell on multiple stocks at once, while trying to trade myself.

What I do is provide you with a support/resistance (S/R) map, watchlists, and technical analysis and commentary throughout the day so you can plan your specific entry and exits. I also provide you with advanced indicator sets so you know when to buy, when to sell, when to hold and when to stay away from the stock.

For example: when I say ABC needs to hold 4.50 then break 4.70/4.80/4.90. This means look for an entry if 4.50 holds (either broke through and closed above, or if the stock bounces off the 4.50 level). Then you have your resistance points which you can look to sell, or hold if the stock breaks those resistance (R) levels and holds. Use these R levels as targets.

These support and resistance levels are based on an advanced math based system that I developed, no one out there has these.

Technical analysis that I provide in alerts includes:

- Watchlists
- Stocks that are ‘in play’ and making moves
- Technical analysis based on the indicator sets provided
- Key support/resistance (S/R) levels
- Double tops/ double bottoms
- Failed breakouts/ Failed breakdowns
- Macro S/R levels
- Micro S/R levels
- Fibonacci retracement levels
- My entries and exits

When reading alerts, keep in mind:

- If you are long biased, you always want resistance to become support (S), so once the stock breaks above the R levels mentioned, they will now become S. The reverse is true if you're short biased.
- You can buy through resistance if all indicators are bull, however the best entry will be where I tell you it needs to hold first.
- You want support to be rising ALWAYS. Do not look at my S/R for this. Look at the chart, look for a series of higher lows, this would be rising support.
- Once new S/R is provided, this is the current S/R, all S/R I mentioned previously should be replaced by the new S/R mentioned.
- Do not hold these stocks overnight or hold hoping it will go back up, trust your indicator sets not your emotions. If you're in a trade and don't know what to do, tag me [@Young Bull Investor](#) or [@President](#) for guidance

100

Plot the S/R levels, Hold numbers and the In play numbers mentioned in alerts (Small Caps)

When I alert a stock with hold numbers, in play numbers & R levels, you MUST plot them on your charts because they are KEY levels, no other retail traders have them. These levels, paired with your Technical Indicators will give you your entry points & exit targets.

🔍 (edited)

12:49 AM

📁 11👍 1👍 1👍

100

Plotting the Hold numbers, In play numbers & S/R (for TOS users)

This is an example of how to plot the hold numbers, in play numbers & S/R I mention in alerts.

First select the 'Price level' Drawing tool which is the one with the '\$' dollar symbol with the line below it.

Ideally you want to clearly show which line is the hold number, in play number and S/R, so you want to colour code them. In the example shown, I have the hold number as an **Orange** line, in play number as a **Yellow** line, then the S/R all in **White**. To colour code them, first plot all of the lines, then you want to right click the line you want to change the colour of, click "Edit Properties" then change the Colour in the **Bottom Left**.

For trading view users, see the video in #📺 | trading-view-indicator-setup-... (edited)

Support and resistance :

-support-and-resistance

Young Bull Investor

6/2/24, 10:50 PM

Support and Resistance

Support (S) are areas where there will likely be demand (buying/covering).

Resistance (R) are areas where there will likely be supply (selling/shorting).

Example 1: if a stock is at \$2.80, I might see resistance at 3, 3.11 & 3.25 so I will put in the chat 3/3.11/3.25 R, this will let you know where there is likely to be supply (selling/shorting), so you have a heads up to exit your position at any of those resistance levels if there is a failure at those levels. If the stock breaks through 3, 3.11 & 3.25, I will then give you the next resistance levels. If a stock holds above resistance levels then it is good to go.

Example 2: if a stock is at \$2.80, I might see support at 2.75, 2.63, 2.55, so I will put in the chat 2.75/2.63/2.55 S, this will let you know where there will likely be demand (buying/covering), so you have a heads up on where to buy if it comes down to those levels and also where to give the stock room to if you are already in. If the stock breaks below those levels, I will give you the next areas of support.

As a **LONG** you want the price to hold support and break through resistance. You also want support levels to rise, and also Resistance levels to rise. You do not want the stock to fail at resistance and break below support. You also do not want lowered resistance and lowered support. **Rising** Support and **Lowering** Resistance shows indecisiveness, in this situation you want either Resistance or Support to break for confirmation of trend.

As a **Short** you want the price to Fail at/Hold below Resistance and break below Support. You also want Resistance levels to lower, and also Support levels to lower. You do not want the Price to hold at Support or break above Resistance. You also do not want rising Resistance and rising Support.

Here is a list of key support and resistance levels to plot on your chart or be mindful of:

Previous high of the day

Current high of the day

Afterhours high

Pre-market high

Afterhours low

Pre-market low

30

3

2

1

1

1

1

-support-and-resistance

Support and resistance levels with Fibonacci retracements:

Here is a tool I use every day. This is a type of technical analysis called Fibonacci retracements. I am sure most of you have heard of them before. Make sure you are on a 1 day 1 minute chart, select fib retracement as a drawing tool, draw from the low which was 0.75, to the high of 2.26. You will then have macro support/resistance (bigger picture). The specific fib retracement I care about is the 50% line. Below is bear and NOT in play. Above it remains in play. Very good for bounces off of the 50 fib too. If the high changes, then you will have to extend the Fibonacci retracements to that high.

12

To get it to the exact high and low using the Fibonacci on mobile, draw a Fibonacci retracement anywhere, then hold your finger on it, click properties, then change your 'end point' to the high (2.26 in the example above), then change your 'begin point' to the low (0.75 in the example above)

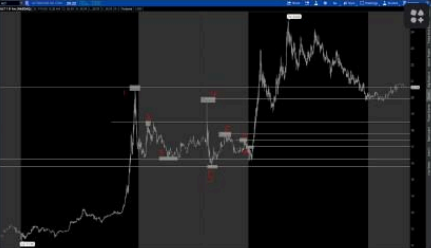

5

-support-and-resistance

Finding S/R before market open:

Here is an example of how to find key S/R levels on a stock before the market open. The rectangle areas highlights the reason for me plotting the S/R level there. These levels include yesterday's high (1), after hours high (2), after hours low(3), pre market high(4), pre market low(5), recent R levels previous to market open (6,7,8).

By doing this, you can see this was a clear squeeze, it was above PM low, it was holding the after hours low, then it broke through all recent PM resistance, then through the PM high, then straight through previous days high... beyond obvious. It broke through and held each level all the way to the 22.92 high.

14

3

1

-support-and-resistance

Support/Resistance mentioned in alerts (Small Caps)

The Support/Resistance paired with the Support/Resistance automatically plotted on your indicator sets are all you need with small caps. The S/R provided in alerts are KEY so please make sure you plot them and know which level is the hold number, in play number etc.

Please refer to # [how-to-use-alerts](#) to see how to plot these numbers correctly.

(edited)

Resistance becoming Support & Support becoming Resistance

It is important to know that once price breaks above Resistance, this Resistance now becomes Support. When price breaks below Support, this now becomes Resistance.

(edited)

Here is an example of Resistance becoming Support:

In this example I show 2 different times when Resistance became Support.. You see the 5.08 Level was a previous Resistance level which held as Support (circled blue). You then see the next Resistance level at 5.44 which held as Support (circled blue).

Basic trading and stock market terminology:
Break - Breaks above a specific level with candle close above
Hold - Candle(s) do not close below a certain level
S - Support
R - Resistance
Bull/Bullish - When a stock is going higher
Bear/Bearish - When a stock is going lower
Macro - Bigger picture
Micro - Smaller picture
PM - Pre-market
PMH - Pre-market high
PML - Pre-market low
AH - After hours
HOD - high of the day

🔥 19

👍 12

😬

Small cap basics:
We only LONG Small Cap Stocks. Do NOT short them.

We only trade the 1min timeframe.

The Small Cap stocks are purely day trading stocks, we do not invest in these stocks, we are in and out on the same day. We also do not hold onto a losing position in hope that it will come back, hope is NOT a strategy. Always have a plan of your entry, where you are going to take profit and where you will take a loss.

Small Cap stocks can be manipulated pretty easily because their floats are typically low (float is the amount of shares for the public to trade). Because of this they can have big whipsaw volatile moves, these moves nearly always occur from multiple rejections, failed breakouts/failed breakdowns. You will learn about this in [#📊 | basic-chart-reading](#)

The main aim with Small Cap stocks is to achieve \$1/share per day consistently. This doesn't have to be in one trade, small scalps of 10c/share, 20c/share moves add up. You should NOT be trading live money until you can achieve minimum \$1/share consistently on Demo trading.

If you can achieve minimum \$1/share per day then you will be very successful. \$1/share with 1000 shares is \$252,000/year.. 5000 shares that is over \$1M/year. This is just on \$1/share, there will be many days where you have the opportunity to make multiple \$/share. Small caps have crazy moves, I have seen over \$100/share moves in 1 day.

We do not trade off of old school chart patterns such as Bull Flags, Head and Shoulders etc. We trade based on Technical Analysis which you have on your chart indicator sets. Using Technical indicators & Support/Resistance to make your entries and exits. Again, you will learn about this in the [#📊 | basic-chart-reading](#) and [#📊 | small-caps-trading](#) (edited)
